

Automated Inventory Management with n8n

Project Overview

This project demonstrates how workflow automation can help a business monitor inventory levels and identify products that need replenishment.

Business Problem

Manual inventory monitoring can be time-consuming and may cause businesses to overlook low-stock products.

Solution

An n8n workflow processes inventory data, compares stock quantities with predefined reorder levels, and identifies products requiring attention.

Technologies

- n8n
- Sample inventory data (CSV or spreadsheet)
- Conditional logic
- Email or messaging notifications (if configured)

Key Features

- Inventory data processing
- Low-stock detection
- Reorder alerts
- Automated workflow execution (when configured)

How to Test

Import the exported workflow into an n8n instance, configure any required credentials, and test it using the supplied sample inventory data.

Project Status

Portfolio project. Features and integrations depend on the included workflow configuration.
